

SecureDR

Real-Time Disaster Recovery and Data Protection

Seccom Global's **SecureDR** solution is a real time backup and Disaster Recovery Solution that runs incremental backups to a local data repository every 15 minutes and then automatically replicates this data across a secure connection to an offsite data store within our state of the art Data Centres. The solution gives you the ability to seamlessly restore information from either the local or remote device from as little as fifteen minutes ago up to years prior.

SecureDR

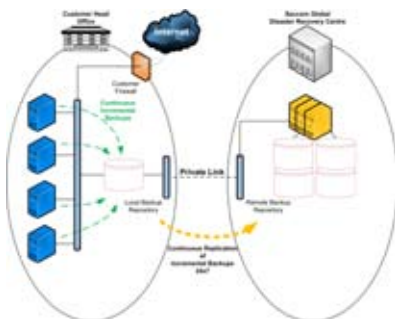

What does SecureDR do?

- **SecureDR** backs up your information up to 96 times per day.
- **SecureDR** can restore files, directories or complete systems seamlessly.
- With **SecureDR** you can bring your system up in a virtual environment within our remote Data Centre.
- **SecureDR** minimises the amount of data having to be backed up through the use of Blocked Based Transfers.
- **SecureDR** reduces the expense associated with normal Disaster Recovery solutions.
- Whether you require to back up one server or many servers **SecureDR** is the solution.

How SecureDR Works

1. The server being backed up will be saved to the local **SecureDR** appliance, this provides for fast local file restore options. The local **SecureDR** appliance keeps files forever by using a collapse technique that keeps;
 - › Fifteen minute increments for up to 3 days that then
 - › Collapse to a daily backup for 7 days that then.
 - › Collapse to a weekly backup for 30 days that then.
 - › Collapse to a monthly backup kept forever.
2. The **SecureDR** appliance is automatically replicated across a secure link to the Seccom Global Data Centre every 15 minutes. Files are stored on the remote data store and collapsed on daily, weekly and monthly increments which can be un-collapsed at a later date for file recovery if required.
3. Once new hardware has been provisioned the SOC can take an image of the virtual server and send this disk to you for a fast an easy restore.
4. The file server being backed up will be saved to the local **SecureDR** appliance, this provides for fast local file restore options. It is recommended the local **SecureDR** appliance keeps files for a period of 1 month. Backups are done in 15 minute increments.
5. In the case of a disaster such as server failure, images can be brought up in a Virtual environment by the Seccom Networks Security Operations Centre (SOC) and given an IP address of your local network. This Virtual solution will appear as a local device on your network.

How SecureDR works
